

Android check sd card for errors

Continue

Is your Android device low on space? If your phone has a MicroSD card slot, you can use it to expand your space for music, movies or even apps, thanks to the improved SD card features in Android 6.0 Marshmallow. This seems like a big change for Google. After shunning SD card slots in Nexus devices and recommending manufacturers stay away from external storage, Android is now beginning to better support them. Portable vs. Internal Storage RELATED: How to Buy an SD Card: Speed Classes, Sizes, and Capacities Explained There are two ways to use an SD card with your device. In the past, Android has traditionally used all SD cards as portable storage. You can remove the SD card from the device and plug it into your computer or another device and transfer files, like videos, music, and photos, back and forth. Your Android device will continue working properly if you remove it. Starting with Android 6.0 Marshmallow, though, some phones can use SD cards as internal storage as well. In this case, your Android device "adopts" the SD card as part of its internal pool. It'll be treated as part of your internal storage, and Android can install apps to it and save app data to it. In fact, since it's considered internal storage, any type of app can be installed to the SD card-including apps that provide widgets and background processes. Unlike older versions of Android, it doesn't matter whether the developer has disabled the "move to SD card" permission or not. However, when you use an SD card as internal storage, Android formats the SD card in such a way that no other device can read it. Android also expects the adopted SD card to always be present, and won't work quite right if you remove it. This method is useful if your phone doesn't come with very much space to begin with, and you want more space for your apps and files. In general, it's probably most convenient to leave MicroSD cards formatted as portable storage. If you have a small amount of internal storage and desperately need room for more apps and app data, making that microSD card internal storage will allow you to gain some more internal storage. This comes at the cost of flexibility and possibly slower speed, if the card is slower than your device's internal storage. How to Use an SD Card as Portable Storage Let's say you want to use your SD card or flash drive as portable storage-to watch a movie on your device, or to offload photos and videos that are taking up too much space. Insert the card it into the microSD slot on your device. You'll see a notification indicating your SD card or USB drive was detected. If it's an SD card, you'll see a "Set Up" button. Our screenshots say "USB drive", but this process works the exact same for SD cards. You can then select "Use as portable storage," and you'll keep all the files on your device. RELATED: How to Use Android 6.0's Built-in File Manager To view the contents of the drive, tap the "Explore" button in the notification that appears afterwards. You can also head to Settings > Storage & USB and tap the name of the drive. This will open Android's new file manager, allowing you to view and manage the files on the drive. You can also use other file manager apps, of course. The "Eject" button allows you to safely remove the drive. How to Adopt a MicroSD Card as Internal Storage If you plan on adopting an SD card as internal storage, you'll want to first ensure you're using a speedy SD card. Not all SD cards are equal, and a less expensive, slower SD card will slow down your apps and phone. It's better to pay a few extra bucks for some speed. When adopting an SD card, Android will test check its speeds and warn you if it's too slow and will negatively impact your performance. To do this, insert the SD card and select "Setup." Choose "Use as internal storage." NOTE: Android will erase the contents of the drive, so be sure you've backed up any data on it. You can then choose to move photos, files, and some apps to the new device, if you like. If not, you can choose to migrate this data later. Head to Settings > Storage & USB, tap the drive, tap the menu button, and select "Migrate data." How to Change Your Mind You'll also see the storage device in the Settings app. Open the Settings app, tap the "Storage & USB" option, and you'll see any external storage devices appear here. To turn a "portable" SD card into internal storage, select the device here, tap the menu button in the top-right corner of your screen, and select "Settings." You can then use the "Format as internal" option to change your mind and adopt the drive as part of your device's internal storage. This will erase the contents of the drive, so be careful and ensure you have everything backed up first. To make an "internal" SD card portable so you can remove it from your device, visit Settings > Storage & USB, tap the device's name, tap the menu button, and tap "Format as portable." This will erase the contents of the SD card, but you'll be able to use it as a portable device afterwards. Android's improved support for MicroSD cards is nice, but you're probably better off with speedy internal storage than a MicroSD card formatted to function as internal storage. That SD card will likely be a bit slower. By Perry Piekarski | SD card image by berg_bcn from Fotolia.com SD cards are a commonly used memory format for devices like digital cameras and some video game consoles. However, your SD card can store any data you desire, making it practical for backing up information or bringing your files with you when you're on the go. The amount of space available on an SD card depends on the card, but the space is always limited. Compressing the data on an SD card can cut down on the size of the files on the device, allowing you to fit a bit more and make the most out of the card. Insert the SD card into your PC. If your PC lacks SD card slots, you need a SD to USB converter. Put the SD card into the converter and insert it into any USB slot on your computer. Click the "Start" button on the taskbar and open My Computer/Computer. The shortcut key to bring up the same menu is the "Windows" key plus "E." Right-click the SD card on the My Computer/Computer menu and select "Open". Select all of the SD card's contents by pressing "Ctrl+A." Alternatively, you can select individual files to be grouped by holding "Ctrl" while clicking each file. Right-click the selection, hover over "Send to," and click "Compressed (zipped) folder." A zipped folder will appear on the card within a few seconds, and you can now safely delete the uncompressed data on the card. By Perry Piekarski | sd slot image by TEA from Fotolia.com Secure digital, or SD, cards are a type of Flash memory format intended for use in digital cameras, cellphones and countless other portable electronic devices. Also compatible with your home computer, SD cards are designed to be an efficient and portable method of saving, copying and transferring data between devices. If you want to test an SD card to make sure it's functioning properly, you can do so using your Microsoft Windows PC. Slide the SD card into your computer's SD card slot and press it in until it clicks into place. If the card is functioning, your computer should recognize it within a few seconds. Click the "Start" button on the desktop and choose "Computer" from the Start menu. Double-click the SD card icon to see if it opens. When it opens, you should be able to manage the files as you would any folder on your computer. Files can be clicked and dragged to be added to the card, deleted from the card and dragged to the desktop in order to copy them to your PC. Return to the Computer menu, right-click the icon representing the SD card and select the "Properties" option. Select the "Tools" tab and click "Check now" under the error-checking section of the Properties menu. Check all the options to fix system file errors and to scan for and attempt the recovery of any bad sectors on the SD card. Click "Start" and wait a few moments while Windows checks the SD card for errors. Smartphones are giving us more and more storage space with every new generation of devices. Unfortunately, apps are becoming increasingly demanding, requiring more space to be housed on our phones. At the same time, smartphone cameras are growing more powerful, making the photos we capture with them bigger and bigger. Luckily, many phone manufacturers have offered us a way out of this predicament: SD cards. Depending on the Android smartphone you own, you'll find a slot for an SD or microSD card on its side. By using this slot, you'll be able to house not only files but also apps. Accordingly, this article explains how to move apps to an SD card in Android. It also covers how to use an external SD card as additional internal storage. Looking for a microSD card? Check out our article on the best microSD cards available right now. How to move apps to an SD card in Android First of all, make sure you've actually inserted your SD or microSD card into your Android's slot. This can be done by using a pin or needle to pop out the card tray, which you should find on the side of your phone (some phones allow you to insert the card directly into the slot, without pulling out a tray). Make sure you place the card the correct way up on the slot, with the label facing up. You'll then be given a prompt to format the card when inserting it for the first time. Assuming your SD card has been properly inserted, you can move apps to it by doing the following: Step 1: Go to Settings > Apps & Notifications > App Info/See All Apps. Step 2: Tap the app you'd like to move to your SD card and then tap Storage (this might be displayed as Storage and Cache on some phones). Step 3: Tap Change, which you'll see under the Storage Used heading. If you don't see this option, it's not possible to move this particular app to an SD card. Step 4: Select your SD card from the options available, and then tap Move. That's it. However, if you want to move the app back to your phone's internal storage, simply go through the process above, except choose Internal storage during Step 4. How to use an SD card as internal storage in Android With certain Android smartphones, you may not be able to move apps to an SD card, even if your phone does have such a card. Fortunately, some Androids let you use your SD card as if it were part of their internal storage, via a process known as Adoptable or Flex Storage. This includes devices manufactured by Huawei, Motorola, and HTC, but not those made by Samsung and LG. To set up your SD card as part of your phone's internal storage, go to Settings > Storage > [Your SD Card]. Once you've selected your SD card, tap More (it looks like three vertically aligned dots) and then tap Storage Settings. Lastly, tap Format as Internal. This option requires you to erase all of the pre-existing contents of your SD card, so if you already have important files on it, you may need to transfer them first or refrain from formatting it altogether. Also, you will need a pretty good microSD card if you want to use it as internal storage for your phone. That means you'll need an Ultra High Speed (UHS) SD card, preferably one that's UHS-3 rather than UHS-1. Editors' Recommendations
